Vanderbilt not affected by Ripple20

Vanderbilt are pleased to announce that the company's product portfolio is unaffected by Ripple20.

Ripple 20 is a set of vulnerabilities discovered this year in a software library that implemented a TCP/IP stack. The security concerns were found by JSOF, which named the collective vulnerabilities for how one company's code became embedded into numerous products.

Following this recent emergence of **Ripple20**, Vanderbilt conducted an internal investigation with the company's product and technical teams. This investigation confirmed that the below product lines are unaffected by Ripple20.

- **ACT365**
- **ACTpro**
- **SPC (all firmware versions)**
- **ComNet**
- **SiPass**

Note: Vanderbilt products and systems may interact with third-party products that have been affected by Ripple20. In such situations, Vanderbilt recommends that the third-party verify if their products are affected and advise on any potential impacts that Ripple20 may pose.
